Think over the following questions:

- **How would you represent testing of the application with multiple browsers?**

Testing on multiple browsers can be represented using fork and join as the two processes should be carried on concurrently and the modifications should be made only when both of the tests are passed.

- **Can generation of the patch file and update the Subversion repository be done concurrently?**

No, as for generation of patch file should be carried out before the commitment of the local code and only after local code is committed, Subversion repository can be updated/

- **Can patching the production code and updating the Subversion repository be done in parallel?**

No, as for updating the Subversion repo, local code should be committed, and patching should be done before commitment.
